

(a) conflicting values

```
def f(xs):  
    sum_all = len(xs)  
    ww = sum_all + 3  
    qq = ww + 4  
    return qq  
f([5, 3])
```

code: `len(xs) = 2`

name: `sum(xs) = 8`

the call returns 9

(b) OLMo-2-7B's traces

Examples show: `v = 3`

`sum_all = 8, ww = 11, qq = 15`

answers 15 (wrong)

Examples show: `v = len(xs) = 3`

`sum_all = len(xs) = 2, ww =`

`sum_all + 3 = 5, qq = ww + 4 = 9`

answers 9 (correct)
